

1. Introduction to Databases: Definition, purpose, and types of databases.
2. Database Users: Types of users, such as database administrators, database designers, end users, and system analysts.
3. Characteristics of the Database Approach: Self-describing nature, insulation between programs and data, data abstraction, support of multiple views, and sharing of data.
4. Applications of DBMS: Various fields where DBMS is used, such as banking, airlines, universities, credit card transactions, telecommunication, finance, sales, manufacturing, and human resources.
5. Advantages and Disadvantages of DBMS: Benefits, such as controlling redundancy, restricting unauthorized access, and providing persistent storage, as well as drawbacks, such as high initial investment, overhead, and complexity.
6. Database System Concepts and Architecture: Data models, schemas, instances, three-schema architecture, and data independence.
7. Centralized and Client/Server Architecture: Types of architectures used in DBMS, including centralized, two-tier client/server, and multi-tier client/server.
